

## With TRu3Tec<sup>TM</sup> you don't have to compromise your precious metal recovery.

As manager of precious metals for your company, we know that you want to be confident that your metal reclaim is the best it can be. Understandably, you need to recover your assets and protect your brand. In order to do that, you need an experienced and knowledgeable partner.

A major problem today is that most incinerators used for precious metal reclaim are often limited or poorly configured. They were designed for other applications and are simply unable to control persistent organic pollutants which harm our environment. This is a proposition that we know you find unacceptable.

We believe that you should have the information and knowledge to protect your company. We understand what it feels like to have to make important decisions when options are limited. This is why we leveraged our 100 years of precious metal recovery experience to design and build TRu3Tec, the best precious metal thermal reduction furnace system in the industry.

We set out to design a system that was diverse enough to carefully manage small batches of high-grade materials while being robust enough to handle larger volumes of lower grade products. The system also needed to be able to accept materials in many forms ranging from liquids and semisolids to dry, bulky materials.

Lastly, and equally important, was to pair this system with a pollution control system able to capture any harmful emissions.

Contact us to learn more or to arrange a plant tour. In the meantime, feel free to [download our TRu3Tec Whitepaper](#).

Stop worrying about how much standard furnaces pollute and instead find the confidence you need knowing all your assets are being looked after.
